The reply does not place the application in condition for allowance or appeal because as taught by Wesinger "connection-oriented and connectionless (e.g., UDP-based) services may be handled using envoys" col. 3, lines 55-64. The applicant argues that Wesinger handles connectionless datagrams traffic in a different manner than the applicant. Also the applicant states the office action uses Wesinger's method of handling "connection-oriented" datagrams to prove applicant's method of "connectionless datagrams". Although not stated in the Office Action it is obvious in the art that "connection" and "connectionless" datagrams can be addressed in the same manner. For further proof of this see text book TCP/IP Illustrated, Volume 1 The Protocols by W. Richard Stevens copyright 1994. IP is the workhorse protocol of the TCP/IP protocol suite. All TCP, UDP, ICMP, and IGMP data gets transmitted as IP datagrams (Figure 1.4). A fact that amazes many newcomers to TCP/IP, especially those from an X.25 or SNA background, is that IP provides an unreliable, connectionless datagram delvery service ... The term connectionless means that IP does not maintain any state information about successive datagrams. Each datagram is handled independetly from all other dtaagrams"
